The Right Plant for the Right Place

Have you ever wondered why a plant thrives in one place but struggles in another? The answer often has less to do with the plant itself and more to do with where it has been placed.

Every plant has its own needs. Some prefer direct sunlight, while others grow better in shade. Some need well-drained soil, while others prefer moisture. Temperature, rainfall, soil type, space, and maintenance all play a role in how well a plant grows.

This is why plant selection should be more than choosing something that looks good.

At ECOBUG, we are developing a **Plant Bank** that brings these characteristics together. It can help identify plants suitable for a particular location based on its environmental and spatial conditions.The idea is simple: instead of asking *"Which plant looks good here?"*, we can start asking *"Which plant belongs here?"*Sometimes, the best landscapes are the ones where the plants seem like they were always meant to be there.
