When Nature Becomes Part of the Design

We often think of landscape as something that is added to a building. A lawn here, a few trees there, perhaps a pathway connecting everything together.

But what if the landscape was considered from the very beginning?

A site already has its own character. It has trees, slopes, soil, sunlight, wind, water, and perhaps even wildlife. Designing around these existing conditions can create spaces that feel more natural and connected to their surroundings.Sometimes, preserving an existing tree can be more meaningful than planting ten new ones. Sometimes, allowing rainwater to follow its natural path can be better than forcing it somewhere else.

Landscape architecture is not always about adding more. It can also be about understanding what is already there and knowing what should remain.Good design does not always make nature fit the space. Sometimes, it allows the space to fit into nature.
